.. - - - - - .Q: How can I share a File between various instances of my application? I'm making a small application which has multiple views that need to access the same file. The only way I know how to do this is by reading in the file from disk at the start of the program. I'd like to be able to have a single instance of this file which is accessible across all views and instances of the application. Any ideas on how I could achieve this? A: You may consider using an interface to implement the read/write access to the file. Q: Some weirdness with jquery.each() I'm trying to do something very simple, but it's not working. `$(function() { $('.div').each(function(i) { $(this).text('something'); }); });` There's some sort of "bug" when the number of elements is increased. The last element is being set, but the rest are not. Also, if I remove the inner tag, the rest of the divs will work as expected. Any ideas? It's because you're going to the next item in the selector each time. So what is happening is that when you get to the 3rd item it is setting the last one. So you should just be iterating from the beginning of the set: `$('.div').each(function(i) { $(this).text('something'); });` Try this: Or you can use the index of the current item: `$( 82157476af`
